## Abstract

Central control unit for controlling the charging process of a battery that comprises:

- 5 a charger circuit coupled to the battery;
  - a circuit for conditionally prohibiting the charging process when predetermined conditions are met, the conditions comprise at least the condition of  $T_B > T_{max}$ , where  $T_B$  designates the actual temperature of the battery and  $T_{max}$  designates the highest permissible battery temperature, and the further condition when the change of one of the battery current and voltage dI and dU decreases in a predetermined time period below a predetermined threshold level; and
  - a restart circuit for restarting the conditionally prohibited charging, comprising a plurality of inputs through which respective restart signals can be received, wherein a precondition of any restart is that the temperature of the battery  $T_B$  being lower than an acceptable predetermined temperature  $T_{ok}$ .
